

Creating and managing tables

DATA MANAGEMENT IN DATABRICKS

The data library

Create and manage

- Databricks databases group related tables for organization.
- Creating a database sets up a scalable structure.
- Organized data aids access and management.
- Tables store structured data for queries.

Effective management

- Effective management involves querying, updating, and deleting data.
- Deletion should be done carefully to avoid data loss.
- Safe deletion practices include data backup before removal.

Using the LOCATION keyword

- Databricks automatically manages table storage locations.
- Default setup simplifies data storage management.
- Custom storage paths can be set using the `LOCATION` keyword.
- Flexibility is important for compliance, cost, or performance needs.

Overriding the default storage

- `LOCATION` overrides default storage.
- Store data in external cloud locations:
 - examples: AWS S3, Azure Blob Storage
- Useful when integrating with existing infrastructure.
- Ensures compliance for sensitive data.

Dynamic data management

- `LOCATION` supports dynamic data management.
- Move data easily if regulations or costs change.
- Relocate data seamlessly without disruption.
- Maintain structure and workflow during changes.

Views and Temp views

DATA MANAGEMENT IN DATABRICKS

First look at views

- A view saves a query for reuse as a table
- Views are persistent
- Remain available until deleted

View syntax

- `CREATE VIEW` or `CREATE OR REPLACE VIEW` create/update views.
- Useful for dashboards, reports, and consistent query results.

```
-- Create a view to get recipes with a preparation time of 30 minutes or less
```

```
CREATE VIEW QuickRecipes AS  
SELECT recipe_id, recipe_name, ingredients, preparation_time  
FROM recipes  
WHERE preparation_time <= 30;
```

Temp views

- Temp views are temporary and last only for the current session
- Automatically erased when the session ends
- Created using
`CREATE OR REPLACE TEMP VIEW`
- Ideal for quick analysis, staging, or exploratory tasks

Benefits of views

- Ideal for frequently accessed data
 - reusable charts, reports, or logic
- Ensures consistent data across users and saves time
- Simplifies collaboration with shared data logic

Benefits of temp views

- Ideal for quick tasks
- Flexible tools for staging/transformation
- Auto-delete at session end
 - Reduce database clutter

Summary

- Views offer persistent, reusable outputs
- Temp views support single-session tasks
- Effective use leads to:
 - Streamlined workflows
 - Enhanced collaboration
 - Optimized performance
